

Analysis of Real World Football Performance on Sorare NFT Cards

Introduction

What we are going to talk about

Motivation

Data Integration

Analysis

Sorare is a
blockchain-based
fantasy soccer game
that digitizes the
collection
and exchange of
football cards.

Data Retrieval Strategy

www.api-football.com

Our data retrieval strategy involved using the football API to gather data on leagues, seasons, and players and their stats.

www.api.sorare.com/graphql

We used the Sorare API to retrieve data on Sorare cards and their non-fungible tokens.

Main problem to solve during data integration

Football API

Some descriptive statistics: Daily Trading Volume

Total: 173 M

The most expensive starting 11. Total Worth: € 2.27 M

Average Price by Position (€)

**On average
Goalkeepers get
traded for 175 €.
Defenders have the
lowest average
price (60 €).**

Attackers accounted for nearly 30% of the trading volume, which sums up to 51.3 Million Euros

Average Price by Position (€)

Trading Volume by Position (in 10 M €)

Cards by rarity (in 1000)

In total, we analyzed 959'161 Sorare NFT Football Cards

Cards by rarity (in 1000)

In total, we analyzed 959'161 Sorare NFT Football Cards

There are 2363 unique cards (0.25%), but some players have more than one unique card.

Does the position of play have a significant impact on the average price of a unique Sorare Card?

$$\text{avg}(\log(\text{price})) = x_0 + d_1 * \text{gamesposition}$$

Does the position of play have a significant impact on the average price of a unique Sorare Card, controlling for player statistics?

$$\begin{aligned} \text{avg}(\log(\text{price})) = & x_0 + d_1 * \text{gamesposition} \\ & + x_1 * \text{goalstotal} + x_2 * \text{goalsassists} + x_3 * \text{goalssaved} \\ & + x_4 * \text{avgrating} + x_5 * \text{yellowcards} + x_6 * \text{redcards} \end{aligned}$$

	Coefficient	Standard error	Z-Value	P> z
Intercept	1.3459	0.430	3.129	0.002
Defender	0.0507	0.054	0.942	0.346
Goalkeeper	-0.1593	0.092	-1.730	0.084
Midfielder	0.0081	0.048	0.168	0.866
Goals scored	0.0203	0.004	4.563***	0.000

OLS Regression with heteroscedasticity
robust standard errors

	Coefficient	Standard error	Z-Value	P> z
Intercept	1.3459	0.430	3.129	0.002
Defender	0.0507	0.054	0.942	0.346
Goalkeeper	-0.1593	0.092	-1.730	0.084
Midfielder	0.0081	0.048	0.168	0.866
Goals scored	0.0203	0.004	4.563***	0.000
Goals saved	0.0044	0.001	4.167***	0.000
Average Rating	0.3070	0.064	4.785***	0.000

OLS Regression with heteroscedasticity robust standard errors.

We used other independent variables and ran the regression multiple times.

	Coefficient	Standard error	Z-Value	P> z
Intercept	1.3459	0.430	3.129	0.002
Defender	0.0507	0.054	0.942	0.346
Goalkeeper	-0.1593	0.092	-1.730	0.084
Midfielder	0.0081	0.048	0.168	0.866
Goals scored	0.0203	0.004	4.563***	0.000
Goals saved	0.0044	0.001	4.167***	0.000
Average Rating	0.3070	0.064	4.785***	0.000

OLS Regression with heteroscedasticity robust standard errors

We used other independent variables and ran the regression multiple times.

On average, an increase of the average game rating by 1 (on a scale from 1 to 10) leads to a 30% higher card price

Question

Does the position of play have a significant impact on the average price of a unique Sorare Card, controlling for player statistics?

Answer

No! Controlling for the most important player statistics (Average game rating, Goals scored, Goals assisted, Goals saved, Games played) we cannot find a significant difference between the average prices with respect to their position of play.

Thanks
